

The facial eczema season is here!

Although overall spore counts across the country is low, some very high counts have been observed in South Waikato and Eastern Bay-of-Plenty, and we are seeing occasional animals with biochemistry changes consistent with facial eczema damage.

For facial eczema spore count monitoring you can get weekly update on theASUREQuality website <https://www.asurequality.com/our-industries/livestock/disease-management/facial-eczema-monitoring/>.

For more information on the different tests available to monitor facial eczema risks and assess effectiveness of zinc prevention programs click below to read our article published in the February 2020 Vetscript issue.
